

Neither the Renewed Energy Strategy nor the Climate Change papers discussed nuclear power - at all.

The Climate Change paper indicates 42% of NS greenhouse gas is due to the generation of electricity.

Nuclear is clean and GHG free. It has a smaller footprint than comparable wind generation and it is an energy source that will not run out as will coal and natural gas. The residual heat from nuclear power generation can be used to heat institutions, businesses and other facilities.

Nuclear should be part of the energy solution for Nova Scotia.
