

To whom it may concern,

After reading the "Energy Strategy and Climate Change Action Plan", I have noticed a few points that stir my interests.

Wind energy was mentioned in the consultation paper as one of Nova Scotia's current renewable energy sources. In my opinion wind "farming" is a very viable source of energy in our coastal region. Although there was much dispute over wind farms being an eye-sore, for instance the proposed Pugwash wind farm. How does the Nova Scotia government plan on increasing wind farming, despite wide spread lack of support for the projects?

Biofuels from fish oils were also mentioned as one of Nova Scotia's current sources for renewable energy, as vehicle fuel. When and where will these fish oils be implemented and available for personal vehicles? Where are these fish oils being produced? From which species of fish are these oils being harvested? Also I would like to know if these fish are being farmed, and what is the final destination for the discarded fish remains?

Any information is greatly appreciated.
